**NOTE :** Additional samples of materials shown herein are not required by medical technical intelligence in this theatre. It is requested that samples (at least one and preferably ten of each if available) of any medical preparation not shown be forwarded directly to the Office of the Chief Surgeon, SWPA, APO 707. Japanese medical supplies should be turned over for storage to the nearest Medical Supply Depot or Captured Enemy Equipment Depot. Notification of such stocks in storage will be made to the Office of the Chief Surgeon, SWPA, APO 707.

## FOREWORD

By direction of the Chief Surgeon, SWPA, this manual has been prepared as an aid to the accurate identification of captured Japanese drugs and medicines.

It is obvious that for the proper preservation, classification, and storage of captured material some workable and trustworthy method of identification must be had. The extreme difficulty of learning Japanese in a short period of time must be considered.

The importance of preservation of captured medical material is apparent when one considers that the number of prisoners of war, both military and civil, is rapidly increasing and that we are required by the Articles of the Covenant of the Geneva Convention to provide adequate medical care for them. Likewise, the inevitable day when we shall occupy what is left of the Japanese Empire is fast approaching and may well bring with it a tremendous burden for the Medical Department.

Japanese medical personnel will probably be available to a limited degree only and on our ability to accurately and properly use captured material will depend the saving of many millions of dollars worth of our own supplies and many thousands of tons of shipping space.

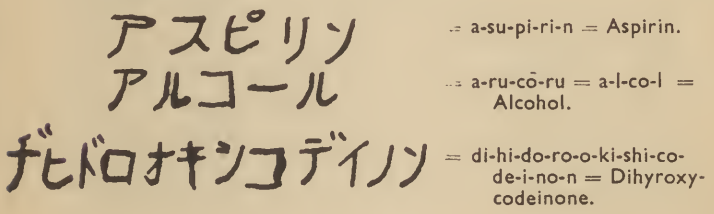
# NOTES ON THE JAPANESE LANGUAGE

Study of the labels of Japanese medical supplies shows that practically everything is written either in Kanji or Katakana. Generally speaking, only drugs of long standing in the history of medicine, such as Quinine or Sodium Bicarbonate, are written in Kanji. Newer drugs, especially important ones as the sulfa group, are ordinarily written in Katakana. This is fortunate because the few older drugs of importance can be readily identified by memorizing or by comparison with reproductions of the complicated Kanji ideographs involved. A few Kanji characters are used in conjunction with Katakana. These, however, are few in number and are constantly recurring. They can be easily memorized. Katakana as used in medical supplies is relatively simple to learn. A chart has been prepared showing the characters found and notes on use of the chart are provided. A few hours' practice in transposing kana into arabic and vice versa should enable one to readily read the labels of their various medicines. Reproductions of preparations are included for reference.

**Katakana.**—This system of writing is purely phonetic. Each character represents a sound which is comparable to our syllable. In most cases the sound is composed of one or two consonants followed by a vowel, as me, ra, chi, or tsu. The five vowels, a, e, i, o, u, and the letter n when the terminal letter of a word have a separate character. The sound "l" is not found in Japanese and is indicated by one of the r sounds, as re or ru. V is not found and is indicated by the sound nearest to it, as bitamin for vitamine and waselin for vaseline.

In working out an unknown the greatest difficulty will be encountered in trying to pronounce the syllable when transposed. It must be remembered that practically every important recent pharmaceutical discovery has been Occidental. So that, when a Japanese reads of mercurochrome, for example, and decides he wants it for his pharmacopeia he has to try to reproduce that word in his archaic language. Some of the results are a bit startling, but by twisting the tongue a bit one can usually suddenly see what he is trying to reproduce. Japanese pronunciation is much softer than English. Vowels are almost invariably short. Thus ra is as in harm and never as in rage. Whenever a vowel is pronounced long, as the o in Dōfuru, it is followed by the sign —. Dōfuru is Dover's.

Examples of translation of an unknown :



A

ア - a

B

バ - ba

ベ - be

ビ - bi

ボ - bo

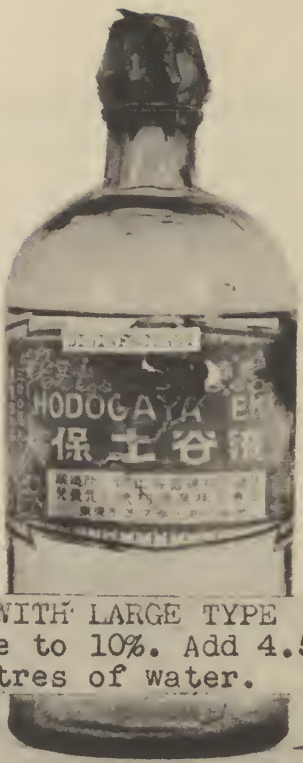
WATER CHLORINIZATION KIT

1. Add 1 spoonful (spoon in kit) of powder from amber bottle to one canteen of water. Shake well for 5 minutes.
2. After 10 more minutes, add 1 spoonful of powder from white bottle.
3. Wipe spoon off.



USED WITH LARGE TYPE FILTER
Dilute to 10%. Add 4.5 cc to 18 litres of water.

Add 1-2 drops to
canteen of water

# 九八式衛生濾水機乙取扱法

陸軍軍醫學校（南方用）

## I 濾水準備

1. 濾水機主体ノ水槽ヲ取去リ附屬品箱内容品ヲ

（直射日光ヲ避ク）

部ヲ乾燥シオクベシ。布シ軸受等廻轉部ニ
ク排水注油シオク。

## WATER FILTER

**Efficiency excellent. Translation of directions for assembly and operation not necessary because any mechanic can easily handle it.**

ハ水槽ニ消毒藥
石炭酸水(33倍)ヲ作
連結ホース、ヲ乙ニ浸30

ARUSHURIN
(A compound of colloidal silver chloride and a salicylate in charcoal. Proportions unknown)
アルシリン
250g
Note: an interesting sidelight is found in the records of ATIS, a PW states that the medicine is used for diarrhea and that it is the same substance as is found in the canister of our gas mask. In the Philippine Campaign when they ran out of [illegible] they used our captured canisters.
